## ABSTRACT OF THE DISCLOSURE

an intracavity-doubled laser to invention relates pumping laser-diode, Nd:YAG device, comprising a a amplifying medium stimulated by a laser beam with a fundamental wavelength emitted by the laser diode, the output face of said amplifying medium being cut at the said fundamental wavelength Brewster angle for birefringent frequency-doubling KNbO3 crystal. The device further comprises an isotropic medium (3), inserted between crystal, input face (8) of the birefringent amplifying medium (2) and the birefringent crystal (4), being fixed to each other such as to provide a monolithic resonant cavity. Furthermore, the crystal axis "c" of the birefringent crystal includes a non-zero angle <c with relation to the orthogonal direction of polarisation of the fundamental wave defined by the Brewster surface.
